

Varicose Veins/Venous Insufficiency

Description: In the United States, varicose veins can be identified in over 50% of persons over the age of 50. Currently, only about 2-3% of those afflicted with this disease are being treated. Many patients and physicians are unaware of

this disease entity and its many presenting features.

Symptoms: Most patients affected will have signs and symptoms of venous disease, which include:

- spider veins
- aching
- swelling
- skin ulceration
- leg heaviness
- skin discoloration
- visibly bulging varicose veins

Evaluation and Treatment: Varicose veins can be successfully addressed through non-invasive diagnostic tests and minimally invasive treatment. Procedures offered include sclerotherapy of skin spider veins, laser treatment of varicose veins, and phlebectomy (removal of diseased veins).

Benefits:

- Outpatient based procedures take less than one hour
- Treatments are greatly successful in resolving both painful symptoms as well as cosmetic issues
